

HARDNESS STABILIZER

It is a dispersing and scale inhibitor agent developed for use in spas to remove and control scale formation and avoid the formation of stains, due to the iron present in the water.

PROPERTIES

Appearance	Liquid
Colour	Colourless
Density	1.04-1.08 g/cm ³

DOSAGE AND INSTRUCTIONS FOR USE

Initial treatment: At the beginning of the bathing season, add 20 ml of product for each m³ of water.

Maintenance treatment: Add 20 ml of product for each m³ of water once a week (1 cap = 20 ml).

These dosages are for guidance only and can be modified in accordance with the hardness and the salt contents of the water.

In spas with hardness greater than 35°F and temperatures of 28°C, the dosage of product should be increased by 25 to 50%.

IMPORTANT: Whenever the water contains iron, it is important to add the product to the water of the spa before chlorination or any oxidation treatment. Dilute the required dose of product in a container of water and distribute the solution evenly over the spa surface whilst the filtration equipment is in operation.
